

REGIONAL DEVELOPMENT IN ECOLOGICAL SENSE

ILIJA ACESKI, PHD¹

ALEKSANDAR MANASIEVSKI, PHD²

Abstract: *Under good regional development, in an ecological sense, it is understood that greater importance is attached to conservation, the economical use of natural resources, and greater use of renewable resources and recycling. Good regional development combines environmental, social and economic aspects and emphasizes the responsibility of all individuals to maintain healthy ties to nature. Then, it increases productivity, and hence international competitiveness, and predicts environmental problems rather than responding to current crises. For him, the increase in production and consumption are not an end in them, but a means to achieve the goal, and that goal is the health of people, security and human life for all mankind. Good can illuminate the path to a more sophisticated community in which a person will have the opportunity to fulfill his own ethical obligations, to be a good country planner and a responsible host for the future for future generations.*

Key words: *natural resources; regional development; ecological sense*
